Powerbrick Broadband UPS

MODEL CODE

PB100

Powerbrick is designed for use inside a broadband network and can operate as a home or small business alarm server. Powerbrick includes a backup uninterruptable power supply for xDSL, FTTx cable and 3/4G wireless network equipment such as modems, routers, switches and WiFi access points. Powerbrick is ideal for broadband installations and those passive networks where power over cable is not available.

The internal battery can provide power to network access equipment for 6-24 hours during a power outage. Powerbrick is fully monitored so when the battery requires replacement a message can be sent to the owner or service technician advising them to install a replacement.
